Artificial Lures

- Jigs and Spoons
- Plastic Baits and Plugs
- Spinners, Spinnerbaits, Poppers and Flies

Artificial or imitation lures are the name given to spinners, jigs, poppers, flies, and spoons. When used, these are seen by fish as a natural food such as a minnow or mayfly.

While bait fishing can be less expensive, lures can be more fun because the lure needs the angler to provide the motion. Fishing lure companies make lures in many sizes, styles, colors, and patterns. You will need to read the instructions on a lure package to learn how to use each lure. Below are a few types of lures.

Jigs

Jigs have weighted metal heads and a "tail" made of animal hair, soft plastic, feathers, or rubber. Anglers sometimes add a minnow or piece of pork rind to the jig's hook. Jigs can be used to catch nearly every kind of freshwater and many saltwater fish.

Spoons

Spoons are metal lures designed to look like a swimming baitfish.

Many spoons are made to be cast while others are meant to be trolled behind a moving boat.

Plastic Baits

Soft-plastic worms, minnows, and crayfish are available in many sizes and colors. You can use them with or without a weight. Sometimes, plastic baits are used with a jig head, spinner or spinnerbait. Some plastic baits have scents attractive to fish built into them.

Plugs

Plugs have a body made of plastic or wood and are designed to be used on top of the water or at depths below the surface. Topwater or floating plugs are designed to float on the surface. Diving plugs have plastic or metal lips so they will dive to a certain depth. These diving plugs are often called "crankbaits" because they are often used with baitcasting reels that operate like a crank.
